

# THE INDEPENDENCE OF CENTRAL BANK: THE TURKISH EXPERIENCE

Cem Mehmet BAYDUR<sup>(\*)</sup>  
Bora SÜSLÜ<sup>(\*\*)</sup>

**Özet:** Rogoff'a göre ekonomi politikalarındaki değişiklik, ekonomik dalgalanmalara neden olmaktadır. Uzun dönemde ekonomik politikaları ortalama çıktı miktarını etkilemeksizin enflasyondaki dalgalanmaları arttırmaktadır. Rogoff'cu bir perspektiften enflasyondaki istikrarsızlık para politikasını yürütme görevi bağımsız bir temsilciye bırakılarak aşılabilir. Bu çalışma Rogoff'un geliştirdiği modele dayanarak TCMB'nin yasal bağımsızlığını analiz etmektedir. TCMB'nin bağımsızlığı Cukierman, Webb, Neyapti (1992) ve Cukierman (1994) endekslerinden faydalanılarak hesaplanmakta ve Nisan 2001 de yenilenen TCMB kanununun TCMB bağımsızlığını geliştirip geliştirmediği de araştırılmaktadır. Test sonuçları TCMB'nin bağımsızlığı ile enflasyon arasında negatif bir ilişkinin olduğunu işaret etmektedir. Bununla birlikte merkez bankasının bağımsızlığı ile çıktı istikrarı arasında bir ilişki bulunamamıştır.

**Anahtar Kelimeler:** Merkez Bankasının Bağımsızlığı, Para Politikası, Zaman Tutarsızlığı

**Abstract:** According to Rogoff, economic variables may fluctuate due to changes in economic policies. In the long run, economic policies result in increases in fluctuations in inflation rate without increasing average output level. From the perspective of Rogoff, problems regarding inflation instability can be overcome by giving the authority of making monetary policy to an independent institution. This study analyzes "legal independence" of the CBRT according to the theoretical framework developed by Rogoff. In addition, we tested independence of the CBRT by using Cukierman, Webb, Neyapti (1992) and Cukierman (1994) index, and concluded that independency of the CBRT has increased after a new law introduced in April 2001. Our econometric tests indicated that there is a negative relationship between inflation rate and independency of the CBRT. We could not, however, find any evidence to accept or reject the hypothesis of "an independent central bank results in a stable output level."

**Key Words:** Independency of Central Bank, Monetary Policy, Time Inconstancy

## I.Introduction

In contemporary monetary policy, it is generally accepted that there is a positive correlation between the independence of central bank and stable inflation. While an independent central bank grants success in fighting inflation, the real output brings instability along with it. As Rogoff (1985) emphasized with his prominent study on the subject, the fluctuations in the real output increase while an independent central bank/monetary authority possesses a

<sup>(\*\*)</sup> Yrd.Doç. Dr. Muğla Üniversitesi İİBF İktisat Bölümü

lower inflation rate in average. According to Rogoff, stability in inflation can only be achieved by such conservative monetary authorities. Empirical studies found negative correlation between independent central banks and the rate of inflation (Pollard, 1993; Prast, 1996).

The relation between an independent central bank and lower inflation is a subject of theory of business cycles. In the two models proposed by this theory, the relation between independent central bank and lower inflation rate is analyzed. The first model is called *choice approach* which is the perspective of Rogoff. According to his model, monetary policy power is left to a conservative central bank. A central bank disliking inflation does not need to consider economic fluctuations, because it needs to create a low inflation rate. This choice will lead an independent central bank to be more successful in fighting with inflation. Thus, monetary policy should be free from political pressures. The second approach is Rawls' approach that describes the basis of independent monetary authority with institutional/constitutional arrangements. The understanding of justice and freedom of Rawls (1975) defines the necessity of why monetary authority should be independent. According to Rawls, the main problem is the distribution of wealth. It is not possible to create an absolute criterion for equality in the distribution of wealth. Social and economic inequalities must be designed according to following criteria: i)the less privileged ones will be more advantageous, ii)duties and roles should be clearly assigned under the conditions that holds equal opportunity.

In this sense, it is more logical to hand over political power to an independent monetary authority to execute economic policy so that it can fight inflation more effectively. Independent monetary authority will provide maximum benefit and equal opportunity by creating relatively low inflation for those who are least privileged. Consequently, according to Rawls' way of thinking, it can be deduced that the independence of monetary authority should be maintained before the founding contract or constitution of a nation is being written (Hayo, 1997, 5).

The main aim of the study the approach of Rogoff will be our starting point in analyzing the relation between an independent monetary authority and inflation rate. This paper consists of three sections. In the first section, Rogoff's model will be revealed after explaining how economic policies increase inflation. After that, the concept of independence of the Central Bank of the Republic of Turkey (CBRT) will be calculated and evaluated. The independence of central bank played a critical role in success of disinflation programs in 1990s. The more independent central banks become the more credibility they will have. Thus, as the credibility of central banks increases, it is going to be easier to reach the targeted inflation level. In the third section, the empirical relation between the independence of monetary authority and output (or inflation) is studied for the 1990 - 2005 period.

## II. A Simple Model for Independence of Monetary Authority

The model used in this paper is an extension of Alesina and Gatti (1995) model and the supply structure of economy or output growth rate ( $y$ ) is determined according to Lucas supply curve.

$$y_t = \pi_t - \pi_t^e + \varepsilon_t \quad (1)$$

In above equation,  $\pi$  is inflation,  $\pi^e$  expectation of inflation,  $\varepsilon$  is normally distributed shock term whose average is zero and variance is fixed. When  $\pi_t = \pi_t^e$ , the amount of output in economy will be equal to the amount of natural output. In this model, the expectations (especially, those about wages) are determined before shocks and policy makers' decision on the inflation rate. Thus, with respect to timing,  $\pi_t^e, \varepsilon$  come first and the policy variable,  $\pi_t$ , decided later by policy maker. Under these assumptions, equilibrium output growth rate in the economy, inflation and expectations of inflation are determined by the policy maker.

The aims of the policy maker, inflation and output growth rate, can be shown with the help of loss function. The loss function described by Equation (2) shows targets of the policy maker. The coefficient  $b$  in the loss function is output importance coefficient of political authority. Any deviation from these targets amplifies loss of policy maker.

$$L = \frac{1}{2}\pi_t^2 + \frac{b}{2}(y_t - k)^2 \quad b > 0 \text{ ve } k > 0. \quad (2)$$

When Equation (1) is placed in Equation (2), the values of  $\pi_t, \pi_t^e, y_t$  are obtained by taking the derivative of  $\pi_t$  and equating it to zero under the assumption of rational expectations.

$$\frac{dL}{d\pi_t} = \frac{2}{2}\pi_t + \frac{2b}{2}(\pi_t - \pi_t^e + \varepsilon_t - k) = 0 \quad (3)$$

According to assumption of rational expectation the Equation (3)  $\pi_t = \pi_t^e$  can be written as follows,

$$\begin{aligned} \pi_t + b(\pi_t - \pi_t^e + \varepsilon_t - k) &= 0 \\ \pi_t &= -b\varepsilon_t + bk \end{aligned} \quad (4)$$

If the expected value of Equation (4) is taken:

$$E(\pi)_t = -bE(\varepsilon_t) + bk$$

As  $E(\varepsilon_t) = 0$ , the inflation expectations of rational individuals can be found as follows;

$$E(\pi)_t = \pi_t^e = bk \quad (5)$$

Since the economic units having rational expectations consider the inflationist impacts of economic policies into account (Hayo, 1997), the policy

maker should consider this behavior while calculating the real inflation as well. Equilibrium inflation as a political variable which minimizes the loss function of policy maker can be found by putting inflation expectation  $E(\pi_t) = \pi_t^e = bk$  in to Equation (3).

$$\pi_t + b(\pi_t - bk + \varepsilon_t - k) = 0$$

If necessary adjustment is done, we have:

$$\frac{-(1+b)\pi_t}{-(1+b)} = \frac{b\varepsilon_t}{-(1+b)} - \frac{k(1+b)b}{-(1+b)}$$

$$\pi_t = kb - \frac{b}{1+b}\varepsilon_t \quad (6)$$

Equation (6) emphasizes two results about the outcomes of economic policies. First, the term “bk” shows the inflationist trend of economic policies<sup>1</sup>. Second part is a term of stability, which shows the diminishing impact of economic policies on inflation (Cukierman, 1994,414-450).

Equilibrium income level can be calculated by putting the values obtained in Equation (5) and (6) in Equation (1).

$$y = bk - \frac{b}{1+b}\varepsilon - bk + \varepsilon$$

$$y = \frac{1}{1+b}\varepsilon \quad (7)$$

$$E(y) = \frac{1}{1+b}E(\varepsilon) = \frac{1}{1+b} = 0 \quad (8)$$

Equation (7) and (8) show the result related to equilibrium income level according to the rational expectations assumption of Rogoff model. The expectation of economic units about equilibrium income level is equal to natural growth rate of the economy. It is necessary to look at variances of inflation and output in order to analyze the effects of economic policies on output and inflation.

$$\text{var}(\pi) = \frac{\sum (bk - \frac{b}{1+b}\varepsilon - bk)^2}{n} = \frac{b^2}{(1+b)^2} \frac{\sum (\varepsilon)^2}{n}$$

$$\text{var}(\pi) = \frac{b^2}{(1+b)^2} \sigma_\varepsilon^2 \quad (9)$$

$$\text{var}(y) = \sigma_y^2 = E(y - E(y))^2 = \frac{\sum [(\frac{1}{1+b}\varepsilon) - 0]^2}{n}$$

$$\text{var}(y) = \frac{1}{(1+b)^2} \sigma_\varepsilon^2 \quad (10)$$

Variances of both inflation and output depend on the coefficient “ $b$ ” which is importance that policy maker put on the output. As “ $b$ ” grows, the output is stabilized and inflationist trend is accelerated.

If policymaker declares policies to be implemented against the shocks at the beginning of the term, and behaves accordingly, the inflationist trend of economic policies is eliminated (Schultz, 1996). Nevertheless, assumption made in this paper accepts that policy maker has no such intention, because policy maker has incentive to divert from its commitments.

According to Rogoff, the inflationist trend in economic policies can only be overcome by empowering an independent representative in making monetary policy. Such an application will increase social welfare. Policy maker should replace the representative and policy at the end of the term or at the end of a designated period.

It is accepted that the importance the designated representative puts on the fluctuation on output ( $\hat{b}$ ) is different than that of policy makers. The representative will determine its own policies according to the shocks that may appear. The policy that representative adopts is the best one for policy maker during that period. Consequently, the problem for the policy maker can be described by equation (11) below: policy maker will assign a representative that can minimize the loss function.

$$\min E\left(L\left(\hat{b}, b\right)\right) = E\left[\frac{1}{2}\left(\hat{b}k - \frac{\hat{b}}{1+\hat{b}}\varepsilon\right)^2 + \frac{b}{2}\left(\frac{1}{1+\hat{b}}\varepsilon - k\right)^2\right] \quad (11)$$

The designated representative will follow the policy rule indicated in equation (6), but it will implement policy rule choosing  $\hat{b}$  instead of  $b$ . If policy maker chooses a representative that will minimize loss function, fluctuations in inflation will slow down. If  $\hat{b}$  in equation (11) is calculated, it is found that  $0 < \hat{b} < b$ .

$$E(L(\hat{b}, b)) = \frac{1}{2}[\hat{b}^2 k^2 + 2\hat{b} \frac{\hat{b}}{1+\hat{b}} \text{Cov}(k, \varepsilon) + \frac{\hat{b}^2}{(1+\hat{b})^2} E(\varepsilon^2)] + \frac{b}{2}[\frac{1}{(1+\hat{b})^2} E(\varepsilon^2) + 2\frac{1}{(1+\hat{b})^2} \text{Cov}(k, \varepsilon) + k^2]$$

$$\text{Cov}(k, \varepsilon) = 0,$$

$$\min E(L(\hat{b}, \hat{b})) = \frac{1}{2}(\hat{b}^2 k^2 + \frac{\hat{b}^2}{(1+\hat{b})^2} \sigma_\varepsilon^2) + \frac{b}{2}(\frac{1}{(1+\hat{b})^2} \sigma_\varepsilon^2 + k^2)$$

$$\frac{dE(\cdot)}{d\hat{b}} = \hat{b}k^2 + [\frac{\hat{b}^2(1+\hat{b}) + (1+\hat{b})^2\hat{b}}{(1+\hat{b})^4}] \sigma_\varepsilon^2 - \sigma_\varepsilon^2 b(1+\hat{b})^{-3} = 0$$

$$\hat{b}k^2 + [\frac{\hat{b}^2 + (1+\hat{b})\hat{b}}{(1+\hat{b})^3}] \sigma_\varepsilon^2 = \sigma_\varepsilon^2 b(1+\hat{b})^{-3}$$

$$\frac{\hat{b}k^2(1+\hat{b})^3}{\sigma_\varepsilon^2} + 2\hat{b} + \hat{b} = b \quad b - \hat{b} = \frac{\hat{b}k^2(1+\hat{b})^3}{\sigma_\varepsilon^2} + 2\hat{b} \Rightarrow a > 0, k > 0, b > 0 \quad (12)$$

$$b - \hat{b} > 0 \Rightarrow b > \hat{b} \quad (13)$$

Equation (13) clearly shows the deduction of Rogoff's idea, which is  $0 < \hat{b} < b$ . The output importance coefficient of policy maker is greater than that of independent representative. However, the fluctuations in inflation will be smaller for an independent monetary policy representative. The underlying reason for this is the empowerment of independent monetary higher inflation hatred coefficient. According to Rogoff, even if the independent monetary authority decreases fluctuations in inflation, it will increase the output fluctuations. Equations (9') and (10') below show this as follow:

$$\text{var}(\pi)' = \frac{\hat{b}^2}{(1+\hat{b})^2} \sigma_\varepsilon^2 \quad (9')$$

$$\text{var}(y)' = \frac{1}{(1+\hat{b})^2} \sigma_\varepsilon^2 \quad (10')$$

When  $\text{var}(y) < \text{var}(y)'$  then,  $\text{var}(\pi) > \text{var}(\pi)'$ .

### III. The Independence of Monetary Authority in Turkey

In the first section, it has been revealed that inflation stability is maintained through the concept of independence of monetary authority with the help of theoretical framework developed by Rogoff. This model leaves the power to execute monetary policy to the monetary authority for a designated period. During this period monetary authority is completely independent from political authority. From this perspective, the independence of central bank can be assessed according to legal and economic conditions (Baydur and Süslü, 2002). In order to maintain stability of inflation, laws related to central bank

should authorize monetary authority/central bank to freely use monetary policy instruments. Being entitled by law will not itself be enough to grant the independence of monetary authority. Moreover, an independent monetary authority should not have financial difficulties and balance of payment problems.

CBRT is the single monetary authority in Turkey. Rediscount rate is not the only policy instrument that CBRT can use. Markets can be considered as an instrument of CBRT as well. CBRT can alter exchange and interest rates in accordance with the targets. For example, CBRT has become an efficient actor of interbank markets with growing amount of public bonds by starting open market operations in 1986. Interbank monetary market became effective on April 1996. Foreign exchange markets were opened in CBRT in 1988. CBRT has been able to influence exchange rates and interests with help of establishment of İstanbul Stock Exchange (ISE), development of secondary bond market and the other markets (Keyder, 2002, 78-98). The necessary legal framework was improved in 1990s and completed in 2001. In other words CBRT has full legal control of its instruments.

Even though the legal control over these instruments is absolute, using them efficiently for the aims of monetary authority depends on the economic conditions of monetary authority. In the period between 1980-1990 and 2000s, public deficit and balance of payments problems stayed as instability of Turkish economy and limited effective use of monetary policy.

Public deficit, foreign deficit and saving deficits have resulted in economic imbalance (especially instability in inflation) in Turkey for years. The misconduct of fiscal and monetary policies have been considered as the factors damaging the independence of CBRT. Therefore, some limitations were imposed on the use of resources of CBRT by Treasury, which was secured by a protocol signed in 1997. From 1998 on, Treasury was prohibited to get loans from CBRT. The structural risks (banking sector and lack of social consensus) held by the austerity programme, which implemented in 1999, the abnormal deterioration in balance of payments caused by unpredicted external shocks (the rise in oil prices) and inconsistency between interest-exchange rate and inflation turned into a deep financial crisis in November 2000 and February 2001. These crises led to an intensive use of CBRT resources as the final credit post. In 2001, a 21 billion TL was transferred to the banking sector.

The struggle to overcome the crisis of 2000 and 2001 led to signing a new Letter of Intent with the IMF (Letter of Intent, May 3, 2001). This letter started a new initiative with regard to the independence of CBRT. The willingness of CBRT to use the inflation itself as an anchor along with monetary anchor in this period accentuated the concept of independence. Because, as shown above, the importance that an independent monetary authority puts on inflation is greater than the political authority ( $\hat{b} < b$ ). As the

first major step of the process the Law of Central Bank was amended so as to grant operational independence to the Central Bank as part of its primary duty to maintain price stability. The amendment involves many significant prerequisites: assigning price stability as primary duty of CBRT; official reporting to the government the developments recorded in the implementation of this target; appointing to term of office of not only Central Bank Governor and Governing Board but also of Vice-Governors for a fixed term; and establishment of Monetary Policy Committee to recommend on planning and implementation of monetary policies. Above changes forbade CBRT to give any direct loan (including buying treasury bills from primary markets) after the transitory period which ended in the beginning of November 2001. The Central Bank aims strengthening the technical infrastructure necessary for the implementation of inflation targeting, including the improvement of inflation prediction techniques and the procedures of monitoring monetary policy and improvement of accountability” (CBRT, 2001)

All these requirements describe the transfer of the process of monetary policy implementation from political authority to an independent authority, which was achieved by a new law passed in 2001. According to Article 4 of the law passed on April 25, 2001, the primary mission of the CBRT stated as follow: “The primary mission of the Bank is to maintain price stability. To do so, the Bank decides on the monetary policy to follow and monetary policy instruments to use directly itself. The bank reinforces the growth and employment policies of Government on the condition not to conflict with the target of price stability<sup>2</sup>.

The CBRT is equipped with many rights to achieve the aims of fighting with the inflation. While the law passed in 2001 defines the primary duty of the CBRT as the fight against inflation, it renders the CBRT absolutely independent to decide on monetary policy.

CBRT does not decide on the monetary policy separately from political authority. But, after the policy, the CBRT is completely independent to execute the policy. The law establishes a Monetary Board within CBRT to inform other economic intuitions of the developments<sup>3</sup>. The law also describes the things that the CBRT cannot do. According to Article 52 and 56, the monetary policy instruments are used in accordance with the monetary policy. CBRT can not give any credit or advance to Treasury or other public institutions. Consequently, the public sector is not allowed to use the CBRT’s resources, by the law. But this is frequently criticized, because the Bank is still authorized to lend advances to Saving and Deposit Insurance Fund on extreme conditions as a final credit authority. This regulation does not deflect the inflation target of CBRT in an economy like Turkey with instabilities and high fragility. Because in an economy with massive public debts, tight monetary policy inhibits achieving inflation target (Baydur and Süslü, 2003).

The development of independence of CBRT can be calculated with the help of an index developed by Cukierman, Webb, Neyapti (1992) and Cukierman (1994). This index displays the legal dimensions of the independence of CBRT after analyzing the law passed on 25 April 2001 (Berument and Neyaptı, 1999). This index measures the independence of central bank with all aspects. The main items in constructing the index: i- appointment of governor of central bank, ii-the goals of central bank, iii- establishment of monetary policy, iv whether any loan is given to the public sector. There are 59 sub- evaluation items (see Appendix 1). In order to construct the index, the law of CBRT passed on 25 April 2001 is analyzed. There are some differences constructing a relationship between the law of CBRT and the index. The criteria in which these differences are found are marked with asterisk in Appendix 1.

The reason of this detailed legal framework is to help understand better the criteria included by this index. It will helpful to compare the index values calculated by Cukierman for past years with the index values calculated by us in measuring to development of independence of CBRT. If monetary authority has a full independence, the index will be equal to one. If it has no independence, the index will be equal to zero. Under this logic independence coefficient of CBRT went up from 44 %<sup>4</sup> for the period between 1980 and 1989 to 64 % in 2004.

Whether the independence rates are statistically different is checked through test of ratio. The calculated t value is 2.24<sup>5</sup>. The null hypothesis ( $H_0$ ) that the new CBRT law of April 25, 2001 did not bring any renovation for the independence of CBRT is rejected. Consequently, the independence of CBRT grew after crisis in 2000 and 2001. This growth of independence provided CBRT with greater opportunities in fighting inflation [and maintaining stability at output growth output stability, by definition is not a central concern of the CBRT, this needs rework...] than the past periods. Nevertheless, the index Cukierman developed is an index of legal independence. For economic independence, financial discipline and problems in borrowing remain to be environmental factors weakening the actual independence of CBRT. The other factors worth considering are external dependence of Turkish economy and financing the deficit with short term sources.

#### IV. Econometric Model

According to Rogoff, the inflation fluctuations will be lower with the existence of an independent monetary authority. Even though the independent representative reduces the inflation fluctuations, it will increase fluctuations in output. Equation (9') and (10') below explain this situation.

$$\text{var}(\pi)' = \frac{\hat{b}^2}{(1 + \hat{b})^2} \sigma_\varepsilon^2 \quad (9')$$

$$\text{var}(y)' = \frac{1}{(1 + \hat{b})^2} \sigma_{\varepsilon}^2 \quad (10')$$

The theoretical deduction of (9') and (10') using  $\pi_t = kb - \frac{b}{1+b} \varepsilon_t$ ,

$\pi_t = P_t - P_{t-1}$  transformation,

$$P_t = kb + P_{t-1} - \frac{b}{1+b} \varepsilon_t \quad (6')$$

will be tested by Equation (14) and (14'), (15) and (15').

$$P_t = \beta_0 + \sum_{i=1}^n \beta_i P_{t-i} + \beta_k KUK + \varepsilon_t, \quad (14)$$

$$\varepsilon_t \sim N[0, (h : \text{constant})] \quad (14')$$

Equation (14) is an approach of time series, which tries to predict the inflation considering the past values of inflation and carries a dummy variable in it. In this paper, time series approach is preferred rather than a structural model for inflation. Although it is a simple testing procedure, it will be used here, because it serves very well for the purpose. Inflation tendency coefficient described as “ $bk$ ” in Equation (6') should change depend on independence of central bank. As the dummy variable measures these changes, it is an appropriate testing instrument (Gujarati, 1998:420-450). Along with this test, the relation between independence of CBRT and inflation can be checked by testing whether estimation has a variable variance. As emphasized in Equation (14'), it is accepted that the average of estimation is zero and its variance is fixed. If the economy has been exposed to a structural transformation so as to influence the independence, it is expected that variance and the average of inflation should change. Accordingly, the relation between the independence of CBRT and inflation will be probed by using White's variable variance procedure.

In this paper, the months of the years after 2000 are assigned the value of 1. While the independence of CBRT had been supported by the protocol signed between Treasury and the CBRT in 1997 and the Stand-By Agreement with IMF in 1998, the independence was reinforced with the law, which became effective in 2001. As a result, because the Letter of Intent in 1999 required the independence of CBRT as one of the structural measures, it is appropriate to give the value of 1 for 2000 and 0 for period beforehand. When such modeling is used, the time series used should be stationary. The unit root test results are given in Table 1

Table 1: *Stationary Result*

	Level	1. Difference
CPI	-	-7.936392(a)
Income	-3.355008(c)	-

Two criteria are taken into account in order to calculate the appropriate length of delay. First, the terms of error in equation should not carry autocorrelation. In order to test this, Equations (14) and (15) are estimated separately under the lag taken from 1 to 12. Autocorrelation between residuals for each lag has been tested with LM test. Second, the sum of error squares should be minimum. For this reason, Schwarz Information Criterion is calculated under each lag. The length of lag is taken as the length of lag, which minimizes the information criteria. The length of lag from 1 to 12, probabilities of LM test and AIC values are given in Table 3. It is suggested that error term in  $H_0$  hypothesis in LM test have no autocorrelation. If the marginal significance level of test is lower than the chosen significance level (0.05) of the test,  $H_0$  has to be rejected. According to this, the most suitable length of lag for model (14) is 2. The regression results obtained are shown in Table 3.

Table 2: *Calculating the Length of Lag of Variables*

Lag	LM-p value	AIC	LM-p value	AIC
TUFE		INCOME		
1	0,2478	4,6240	0,7539	5,3378
2	0,0024*	3,8490*	0,0000**	5,3888**
3	0,4723	3,7828	0,6541	5,0900
4	0,1653	3,8190	0,5396	5,2461
5	0,5327	3,8213	0,5869	5,2879
6	0,4139	3,8723	0,6404	5,3248
7	0,4084	3,9089	0,4507	5,3714
8	0,6736	3,9554	0,1672	5,4198
9	0,3641	3,9837	0,0061	5,4454
10	0,7812	3,9989	0,0021	5,4924
11	0,2953	4,0440	0,0000	5,4400
12	0,2842	4,0724	0,0000	5,4642

As seen in Table 3, two lagged values of inflation and dummy variable are significant. The chosen model can explain 43 % of the inflation. The F value is statistically significant. The possibility not to take place is zero for Equation (14). The statistical significance of dummy variable and being negative render Rogoff's theoretical proposition valid for Turkey. The monthly averaged inflation of an independent central bank is different from the monthly average of inflation of a dependent central bank. The independence of CBRT can be tested by White's test. If any changing variance is found, as a result of changes of independence of CBRT, inflation and variance are expected to change. As

can be understood from Table 4,  $n * R^2 = 110 * 0.43 = 47$ , as it exceeds 1 % threshold value with a degrees of freedom 4, it conforms with  $\chi^2$  distribution. Relying on this trial, we can accept that there is variable variance. Such a trial seems to support that the inflation average changes in parallel with the independence of CBRT.

$$y_t = \beta_0 + \sum_{i=1}^n \beta_i y_{t-i} + \beta_k KUK + \varepsilon_t, \quad (15)$$

$$\varepsilon_t \sim N[0, (h : \text{fixed})] \quad (15')$$

We obtain the result in Table 5 if an equation similar to Equation (14) for revenue and exposed to regression. Autocorrelation between residuals of each lag for proper length of lag has been tested with LM test and Schwartz Information Criteria has been calculated. The regression results are given in Table 5. The length of lag of consequent dependent model is taken as the length of lag, which minimizes the information criteria. The length of lag from 1 to 12, LM test possibilities and AIC are given in Table 4. It is suspected that there is no auto correlation in terms of error in  $H_0$  hypothesis in LM test. If the marginal significance level of test is lower than the chosen significance level (0,05, 0,01),  $H_0$  is rejected. Accordingly, the best length of lag for Equation (15) is 2. Regression results obtained are given in Table 5.

The chosen model can explain 76 % of growth rate of output. The F value which shows the appropriateness of this equation modeling inflation is statically significant. The statically insignificant of dummy renders Rogoff's theoretical proposition invalid for Turkey. The impact of an independent central bank on the stability of monthly output has been detected. Consequently, when we expose Equation (15) to regression, as the rise in independence of CBRT changes the variance of error term, Equation (15') can be tested with White Test. If any chancing variance is found, as a result of changes of independence of CBRT, variance of term of error is expected to change. In table 6, the variance does not change according to White Test. In this trial, there is no

statically proof supporting the change of output growth rate in parallel independence of CBRT.

## V. Conclusion

According to the theoretical framework developed by Rogoff, it is proposed that monetary policy should be handed over to an independent representative for economic stability. According to Rogoff, transferring monetary policy to an independent representative has both advantages and disadvantages. While an independent monetary policy representative succeeds in the fight against inflation, it boosts the stability in output. Such representative of monetary policy is called conservative central bank in economic literature. In order to probe this theoretical deduction for Turkey, the independence of CBRT should be calculated. The independence coefficient of CBRT increased from 44 % between 1980 and 1989 to 64 % in 2005. In the equation of inflation described in Table 4, the coefficient of dummy variable which represents the independence of CBRT has been found -1.65 and the new fixed term of inflation equation is obtained when this value is subtracted from the fixed parameter of the equation expressed in Table 4. The value of this fixed term is 2.20. The independence of CBRT has changed level of average inflation. This means that independence decreases the value of output assigned by the CBRT. As Rogoff suggests, economic units determine their inflation expectations according to the importance monetary authority puts on output. In other words, output importance coefficient of an independent monetary authority is smaller:

$0 < \hat{b} < b$ . If asses the fixed coefficient of equation in Table 6 as the output importance coefficient, the output importance coefficient after April 2001 went down from 3.85 to 2.20. This meets the theoretical expectations. White's Variable Variance Test verifies the impact of CBRT independence on inflation. But, the hypothesis that central banks cause instability at output has been verified. The variance of output equations has not changed under White Variable Variance test.

Credibility is crucial element of all monetary policies or inflation targeting. It is apparent that the credibility of an independent central bank is high. For the CBRT, which targeted inflation below 12 % in 2004 and below 8 % in 2005, independence is a vital political instrument to attain its goal. The observation of a negative correlation between inflation and the independence of CBRT is an empiric reality supporting the theory. Consequently, although the independence of CBRT has been reinforced by a legal adjustment, the structural problems of economy should be eliminated to maintain this independence, As long as the sustainability of public debts is not improved, the fragile structure in banking sector is not repaired, and the monopolistic trends of the markets are not halted, the increase in the independence of CBRT will not suffice.

		2- mentioning price stability is the only aim		0,8	
		3- Price stability does not contradict with other aims		0,6	
		4- price stability contradicts with other aims		0,4	
		5-no aim		0,2	
		6- price stability is not only aim		0	
<i>Limitation of Debts</i>					
0,25	(%15)	Limitation of progress			
	(0,15)	1- Government puts limitations on debts		1	1
		2-Progress is allowed but limited		0,66	
		3- Government may alter the limits		0,33	
		4- no limit		0	
	(%10)	Limitations of API transactions			
		1- Government puts obstacles on debt increase		1	
		2-Debt increase is allowed but limited		0,66	
		3- Government may alter the limits		0,33	
		4- no limit		0	0
	(0)				
	(%10)	Who controls debt increase			
	(0,10)	1- CBRT		1	1
		2-Legally determined		0,66	
		3-Law, CBRT, and other authorized institutions together		0,33	
	4-Authorized institution only		0		
	(%5) weights of sub-definitions are equal	Who barrows?			
0,052		1-Federal government only		1	
		2-Federal and local governments		0,66	
	(0,004)	3-Institutions		0,33	0,33
		Private Sector		0	
		Type of limit, if any?			
		1-Cash amount		1	1
		2- % of CBRT capital		0,66	
		3-% of government incomes		0,33	
		4-% of government expenditures		0	
		Length of Credits			
	(0,016)	1-6 months		1	**1
		2- 1 year max.		0,66	
		3- more than 1 year		0,33	
		4- no limit		0	
	Limitations on Interest rates				
(0,016)	1-CBRT loan interest rates cannot		1	1	

Total:0.642  (0,016)		be higher than market rates			
		2- interest rates of CBRT cannot be less than that of min. interest rate in the market		0,66	
		3-Credits cannot exceed a certain level		0,33	
		4-no limitation		0	
		Limitations on primary market debts			
		1- buying government share from primary market is limited		1	***1
		2- no limit		0	

\* CBRT Law, Article 28,\*\* CBRT cannot do rediscount more than 120 days and OMO more than 91 days.

\*\*\* Completely limited.

### Endnotes:

<sup>1</sup> As political authority tries to grow the economy beyond limits, it creates budget deficit. When this deficit is met by source of monetary authority, inflationist trend emerges. See Fraser,1994, Kissmer and Wagner, 1998.

<sup>2</sup> For details, see The Law of CBRT, April 25, 2001.

<sup>3</sup> Monetary Policy Board is comprised of Governor, Vice-Governors, a member elected from member of Bank Board and a unanimously appointed member with the recommendation of Governor. The Undersecretary of Treasury or Vice-Undersecretary (s)he will elect can attend the meeting without a voting right. Vice-Governor and Bank Board membership cease being member of Monetary Policy Board (CBRT Law: 2001).

<sup>4</sup> See Cukierman, 1995.

$$t_{hes} = \frac{P_2 - P_1}{\sqrt{\frac{P_1(1-P_1)}{n} + \frac{P_2(1-P_2)}{n}}} = \frac{0,20}{\sqrt{\frac{0,2464}{59} + \frac{0,2304}{59}}} = 2,24 \quad n: \text{the number}$$

of all central independence criteria in Cukierman index.  $t_{table,0.10} = 1.30$  and

$$t_{table,0.05} = 1.60.$$

$H_0$ = the amendments in 2001 did not bring any renovation for CB independence

$H_1$ = the amendments in 2001 brought renovation for CB independence.

<sup>6</sup> Definitions of these weights are completely subjective (Cukierman, Webb, Neyapti (1992), Cukierman (1994)
